

The Macadamia Nut has a 'secret' white dot that indicates the start of the nut's natural fracture line. The location of this dot is at the opposite end of the more obvious stem point. The fracture line lies between these two points.

Align the vice tip with the 'secret' white dot on the nut

Tighten the vice onto the nut - usually the nut will crack within three turns.

Do not struggle further, if it does not crack then try repositioning the nut. If still no success discard that particular nut.

CAUTION: When tightening the vice, face the open side of the cracker AWAY FROM YOU !

By placing your hand over the open side of the cracker you will reduce the mess that can be made when cracking the nuts.
